MEDICAMENTUSE OF ANGIOTENSIN II RECEPTOR ANTAGONISTS IN THE TREATMENT OF
DIABETIC RETINOPATHYBACKGROUND OF THE INVENTION

10 Interruption of the renin-angiotensin system (RAS)
with converting enzyme inhibitors, such as captopril,
has proved clinically useful in the treatment of certain
disease states, such as hypertension and congestive
heart failure [Abrams, et al., Federation Proc., 43:1314
15 (1984)]. Furthermore, evidence suggests that inhibition
of this system may be beneficial in treating diabetic
retinopathy. Since AII is the biologically active
component of the renin-angiotensin system responsible
for the system's peripheral effects, the most direct
20 approach towards inhibition of RAS and in particular
AII-induced diabetic retinopathy would be blockade of
angiotensin II at its receptor.

SUMMARY OF THE INVENTION

25 The present invention provides a new method of
treatment of diabetic retinopathy in a mammal which
comprises administering to a subject in need thereof an
effective non-toxic amount of an angiotensin II receptor
antagonist.

30 The present invention also provides for the use of
an angiotensin II receptor antagonist in the manufacture
of a medicament for the treatment of diabetic
retinopathy.

DESCRIPTION OF THE INVENTION

35 The present invention is a therapeutic method for

An angiotensin II receptor antagonist of the formula (VI):

which is 2-n-butyl-4-chloro-1-[(3-bromo-2-[2-(tetrazol-5-yl)phenyl]benzofuranyl-4-yl)methyl]imidazole-5-acetic
20 acid or a pharmaceutically acceptable salt thereof.

The above descriptions of classes of AII antagonists for use in the present invention were taken from pending patent applications, noted patents, and publications or from abstracts thereof. Reference
25 should be made to such patents and publications themselves for their full disclosures of such classes and specific compounds within such classes, the entire disclosure of such patents and publications being incorporated herein by reference. Furthermore, examples
30 1-4 teach how to make compounds encompassed by the generic Formulae of (II)-(V).

Many AII antagonists are known in the art and may be prepared by known methods or by variations thereof. Certain AII antagonists employed in the invention may
35 exist in isomeric form. This invention includes all such isomers both in pure form and admixture, including

SUBSTITUTE SHEET

- 21 -

racemic mixtures and their pharmaceutically acceptable salts.

Angiotensin II antagonist activity is assessed by in vitro methods. In vitro antagonist activity is
5 determined by the ability of the compounds to compete with ^{125}I -angiotensin II for binding to vascular angiotensin II receptors and by their ability to antagonize the contractile response to angiotensin II in the isolated rabbit aorta. For the purposes of the
10 present invention the preferred AII antagonists are compounds which are capable of inhibiting the action of AII by at least 50% at a concentration of 1mM or less, and especially preferred AII antagonists are compounds which are capable of inhibiting the action of AII by at
15 least 50% at a concentration of 25nM or less when tested by the following standard methods.

Binding

The radioligand binding assay is a modification of
20 a method previously described in detail (Gunther et al., Circ. Res. 47:278, 1980). A particular fraction from rat mesenteric arteries is incubated in Tris buffer with 80 pM of ^{125}I -angiotensin II with or without angiotensin II antagonists for 1 hour at 25°C. The incubation is
25 terminated by rapid filtration and receptor bound ^{125}I -angiotensin II trapped on the filter is quantitated with a gamma counter. The potency of angiotensin II antagonists is expressed as the IC_{50} which is the concentration of antagonist needed to displace 50% of
30 the total specifically bound angiotensin II.

Aorta

The ability of the compounds to antagonize angiotensin II induced vasoconstriction is examined in
35 the rabbit aorta. Ring segments are cut from the rabbit thoracic aorta and suspended in organ baths containing

SUBSTITUTE SHEET

- 22 -

physiological salt solution. The ring segments are mounted over metal supports and attached to force displacement transducers which are connected to a recorder. Cumulative concentration response curves to
5 angiotensin II are performed in the absence of antagonist or following a 30-minute incubation with antagonist. Antagonist dissociation constants (K_B) are calculated by the dose ratio method using the mean effective concentrations.

10 In the therapeutic use for the treatment of diabetic retinopathy the AII receptor antagonizing compounds of this invention are incorporated into standard pharmaceutical compositions. They can be administered orally, parenterally, rectally, topically
15 or transdermally.

The compounds of the instant invention and their pharmaceutically acceptable salts which are active when given orally can be formulated as liquids, for example syrups, suspensions or emulsions, tablets, capsules and
20 lozenges.

A liquid formulation will generally consist of a suspension or solution of the compound or pharmaceutically acceptable salt in a suitable liquid carrier(s) for example, ethanol, glycerine, non-aqueous
25 solvent, for example, polyethylene glycol, oils, or water with a suspending agent, preservative, flavouring or colouring agent.

A composition in the form of a tablet can be prepared using any suitable pharmaceutical carrier(s)
30 routinely used for preparing solid formulations. Examples of such carriers include magnesium stearate, starch, lactose, sucrose and cellulose.

A composition in the form of a capsule can be prepared using routine encapsulation procedures. For
35 example, pellets containing the active ingredient can be prepared using standard carriers and then filled into a

SUBSTITUTE SHEET

- 23 -

hard gelatin capsule; alternatively, a dispersion or suspension can be prepared using any suitable pharmaceutical carrier(s), for example aqueous gums, celluloses, silicates or oils and the dispersion or
5 suspension then filled into a soft gelatin capsule.

The compounds of the instant invention and their pharmaceutically acceptable salts which are active when administered parenterally (i.e. by injection of infusion) can be formulated as solutions or suspensions.

10 A composition for parenteral administration will generally consist of a solution or suspension of the active ingredient in a sterile aqueous carrier or parenterally acceptable oil, for example polyethylene glycol, polyvinyl pyrrolidone, lecithin, arachis oil or
15 sesame oil. Alternatively, the solution can be lyophilised and then reconstituted with a suitable solvent just prior to administration.

A typical suppository composition comprises a compound of the instant invention or a pharmaceutically
20 acceptable salt thereof which is active when administered in this way, with a binding and/or lubricating agent such as polymeric glycols, gelatins or coca butter or other low melting vegetable or synthetic waxes or fats.

25 A typical transdermal formulation comprises a conventional aqueous or non-aqueous vehicle, for example, a cream, ointment lotion or paste or in the form of a medicated plaster, patch or membrane.

For topical administration, the pharmaceutical
30 compositions adapted include solutions, suspensions, ointments, and solid inserts. Typical pharmaceutically acceptable carriers are, for example, water, mixtures of water and water-miscible solvents such as lower alkanols or vegetable oils, and water soluble ophthalmologically
35 acceptable non-toxic polymers, for example, cellulose derivatives such as methyl cellulose. The

SUBSTITUTE SHEET

- 24 -

pharmaceutical preparation may also contain non-toxic auxiliary substances such as emulsifying, preserving, wetting, and bodying agents, as for example, polyethylene glycols; antibacterial components such as quaternary ammonium compounds; buffering ingredients such as alkali metal chloride; antioxidants such as sodium metabisulfite; and other conventional ingredients such as sorbitan monolaurate.

Preferably the composition is in unit dose form.

10 Doses of the compounds of the instant invention in a pharmaceutical dosage unit will be an efficacious, non-toxic quantity selected from the range of .01 - 200 mg/kg of active compound, preferably .1 - 100 mg/kg. The selected dose is administered to a human patient in

15 need of treatment of diabetic retinopathy induced by angiotensin II from 1-6 times daily, orally, rectally, topically, by injection, or continuously by infusion. Oral dosage units for human administration preferably contain from 10 to 500 mg of active compound. Lower

20 dosages are used generally for parenteral administration. Oral administration is used when safe, effective, and convenient for the patient.

No unacceptable toxicological effects are expected when compounds of the invention are administered in

25 accordance with the present invention.

The following examples are intended to illustrate, but not to limit, the present invention. Examples 1-4 describe how to make certain compounds encompassed by the generic formulae of (II)-(V). The remaining

30 examples are directed to pharmaceutical compositions of this invention. The compounds included in these disclosed compositions are representative of the AII receptor antagonists included within the scope of the instant invention, but therapeutically effective amounts

35 of other AII antagonists as discussed hereinabove may be substituted.

The procedures of Examples 1-4 are illustrative of the synthesis of compounds encompassed by generic formulae (II)-(V). Substitution of starting materials by the appropriate known reagents yields additional compounds within the scope of formulae (II)-(V).

Reagents, protecting groups, and functionality on the imidazole and other fragments of the molecule must be consistent with the proposed chemical transformations. The procedure of Example 1 is illustrative of the synthesis of compounds encompassed by generic formula (II).

Example 1

3-[(2-Chlorophenyl)methyl]-2-propylthio-N-butylhistidine

(i) 5-carboxymethyl-1-(2-chlorophenyl)methyl-2-thio-1H-imidazole

A solution of 2-chlorobenzylamine (14.2 g, 0.1 mol) and triethylamine (13.9 mL, 0.1 mol) in dimethylformamide (100 mL) was treated with methyl chloroacetate (10.9 g, 0.1 mol). The mixture was heated at 50°C for 3.5 hours. The cooled reaction mixture was diluted with diethyl ether, the solids filtered and the concentrated filtrate was flash chromatographed over silica gel with 6:4 hexane in ethyl acetate to provide 15.3 g (71%) of homogenous methyl 2-[N-(2-chloro-phenyl)methyl]aminoacetate. This product (15.2 g, 0.071 mol) in xylene (100 mL) was treated with 98% formic acid (2.74 mL, 0.0711 mol) and the mixture was refluxed for 2.5 hours with a Dean-Stark water separator. Evaporation gave 17.1 g (99%) of methyl 2-[N-(2-chlorophenyl)methyl-N-formyl] aminoacetate. This formylated product (17.0 g, 0.071 mol) was dissolved in methyl formate (13.3 mL, 0.216 mol) and added dropwise to a sodium methoxide mixture prepared by adding sodium metal (1.79 g, 0.0778 g-atom) to tetrahydrofuran (325 mL) followed by slow addition of methanol (3.15 mL, 0.0778 mol). The

SUBSTITUTE SHEET

- 26 -

combined mixture was stirred at room temperature for 18 hours, then evaporated to dryness. This crude product was dissolved in 50% aqueous methanol (200 mL), treated with charcoal, filtered and the solution was cooled in ice. Concentrated hydrochloric acid (14.3 mL of 12 N, 0.171 mol) was added slowly to this solution followed by a solution of potassium thiocyanate (8.6 g, 0.0885 mol) in water (20 mL). Imidazole was converted to the 1-diethoxyorthoamide derivative by the method of Curtis and Brown, J. Org. Chem., (1980), 45, 20. Imidazole (12.8 g, 0.19 mol) and 118.4 g (0.8 mol) of triethylorthoformate were reacted in the presence of 1 g of p-toluenesulfonic acid to give 20.6 (61%), bp 65-70°C (0.1 mm) of 1-diethoxyorthoamide imidazole. This product (24.0 g, 0.14 mol) was dissolved in dry tetrahydrofuran (250 mL), cooled to -40°C and n-butyl lithium (0.14 mol, 56.4 mL of 2.5 M in hexane) was added at -40°C to -35°C. After 15 minutes n-butyl iodide (31.1 g, 0.169 mol) was added at -40°C, and the reaction was stirred overnight at ambient temperature. The reaction was partitioned between ether and 0.3 N hydrochloric acid, and the organic layer was repeatedly extracted with dilute hydrochloric acid. The combined aqueous extracts were neutralized with sodium bicarbonate solution, extracted with methylene chloride, dried over magnesium sulfate and concentrated. A flash distillation on a Kugelrohr apparatus provided 14.8 g (85%) of 2-n-butylimidazole.

2-n-Butylimidazole (9.7 g, 0.078 mol) was dissolved in methanol (50 mL) and added dropwise to a solution of sodium methoxide (from sodium hydride (2.31 g, 0.0934 mol) in methanol (250 mL)). After one hour the solution was evaporated to dryness, and the sodium salt was taken up in dry dimethylformamide (150 mL) and 2-chlorobenzyl

V. ☒ OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE ¹

This International search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claim numbers _____ because they relate to subject matter not required to be searched by this Authority, namely:
 Remark: Although the claims are directed to a method of treatment of the human or animal body (Article 52(4) EPC), the search has been carried out and based on the alleged effects of the compounds.
2. ☒ Claim numbers 1-11 (incompletely) because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful International search can be carried out, specifically:
 A compound cannot sufficiently be described by its pharmacological activity alone (see claim 1).
 In view of large of number of compounds, which are defined by the general formula of claim 2, the search had to be restricted for economic reasons. The search was limited to the compounds mentioned in the claims.
 The claimed therapeutic activity of the compounds are not supported by any
3. ☐ Claim numbers _____ because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²

This International Searching Authority found multiple inventions in this International application as follows

1. ☐ As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the International application
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims _____
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers _____
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest
- ☐ No protest accompanied the payment of additional search fees
